

$$V_c = 300 \text{ mL} = 0.3 \text{ L} \left( \frac{10^{-3} \text{ m}^3}{\text{L}} \right) = 3 \times 10^{-4} \text{ m}^3$$

$$M_c = \rho_{\text{water}} V_c = \left( 1000 \frac{\text{kg}}{\text{m}^3} \right) V_c = 0.3 \text{ kg}$$

Now:  $Q_{\text{net}} = Q(\text{to warm ice to } 0^\circ\text{C})$   
 $+ Q(\text{to melt ice at } 0^\circ\text{C})$   
 $+ Q(\text{to warm water that was ice to } T_f)$   
 $+ Q(\text{to cool coffee to } T_f)$   
 $= 0$

So:

$$Q_{\text{net}} = M_i c_i (0^\circ - T_i) + M_i L_f + M_i c_w (T_f - 0^\circ\text{C})$$

$$+ M_c c_w (T_f - T_c) = 0$$

$$M_i (-c_i T_i + L_f + c_w T_f) = -M_c c_w (T_f - T_c)$$

$$M_i = \frac{-M_c c_w (T_f - T_c)}{(-c_i T_i + L_f + c_w T_f)}$$

$$c_w = 4190 \text{ J/kg}^\circ\text{C} \quad c_i = 2090 \frac{\text{J}}{\text{kg}^\circ\text{C}}$$

$$L_f = 3.33 \times 10^5 \text{ J/kg}$$

So:

$$M_i = 0.0602 \text{ kg} = \underline{\underline{60.2 \text{ g}}}$$
